Supertankers and Superports (Citations from the NTIS Data Base).
Aug 79,
Guy E. Habercom, Jr.

National Technical Information Service, Springfield, VA.

Report period covered: Rept. for 1964-Jul 79,

Supersedes NTIS/PS-78/0814, NTIS/PS-77/0700, NTIS/PS-76/0591, NTIS/PS-75/510, and NTIS/PS-74/088. For the companion Published Search of the Engineering Index Data Base, see NTIS/PS-79/0850.

Construction and operation of supertankers and requirements for port facilities are reviewed in these Government-sponsored research reports. The environmental aspects are investigated. (This updated bibliography contains 187 abstracts, 38 of which are new entries to the previous edition.)

ABOUT NTIS

The National Technical Information Service (NTIS) of the U.S. Department of Commerce is the central source for the public sale of documents resulting from government-sponsored research and prepared by federal agencies, their contractors or grantees, or by special technology groups. NTIS also is a central source for federally generated machine processable data files.

As one of the world's leading processors of specialized information, NTIS ships about 23,000 information products daily, supplying the public with approximately 6 million documents and microforms annually. Its collection exceeds 1 million documents, all of which are available for sale.

NTIS is an atypical government agency because it operates much like a business. It is obligated by Title 15, U.S. Code 1151-7, to recover its costs from sales and therefore must charge for its products and services.

NTIS provides various types of services to meet the needs of its diverse user population. Through the use of these services one may obtain abstracts of reports in the NTIS collection and, after determining from the abstracts which reports are of interest, order the reports in paper copy or as microfiche.

Services provided by NTIS include a standing order service (SRIM) that automatically provides subscribers with the full texts of research reports selected to satisfy individual requirements; an all-inclusive biweekly journal (Government Reports Announcements & Index) published for librarians, technical information specialists, and those requiring summaries categorized in a single volume with an index; and newsletters published in 26 categories of specialized interest. The NTIS Bibliographic Data File on magnetic tape is available for lease.

Information concerning the products and services offered by NTIS may be obtained by requesting brochure number NTIS-PR-154.

ABOUT NTISEARCHES

NTISearches are online information products developed from the NTIS data base which contains more than 600,000 document/data records of government sponsored research. NTIS provides two types of NTISearches: Published Searches and customized Online Searches.

Published Searches are bibliographies with abstracts that provide a quick, inexpensive way to determine which reports in the NTIS data base are of special interest to a user. The Searches are prepared by NTIS information specialists and are available in many topic areas; they are updated at regular intervals and cost $28.00 each. The cost of a Published Search will be credited toward the cost of a customized Online search in the event the Published Search does not meet ones needs. A complete list of current Published Searches is available free by requesting brochure number NTIS-PR-186.

Customized Online Searches are bibliographies with abstracts that are prepared to meet a special information need which is not met by a Published Search. They may be initiated either by writing to NTIS or by calling the Online Search telephone number (703) 557-4640 to discuss specific areas of interest with an information specialist. The cost of a customized Online Search is as follows:

	North American price	All others
Up to 100 technical report summaries	$100	$125
101 to 200 technical report summaries	125	160
201 to 300 technical report summaries	150	190
301 to 400 technical report summaries	175	220
401 to 500 technical report summaries	200	250
More than 500 technical report summaries		Negotiated

Under New Management. Port Growth and Emerging Coastal Management Programs

Washington Univ., Seattle. Inst. for Marine Studies.*National Oceanic and Atmospheric Administration, Rockville, MD. Office of Sea Grant.
AUTHOR: Hershman, Marc; Goodwin, Robert; Ruotsala, Andrew; McCrea, Maureen; Hayuth, Yehuda
F1411F1 Fld: 13B, 5A, 48B*, 47, 85G, 43, 86M GRAI7916

Rept No: WSG-78-4
Grant: NOAA-04-7-158-44021
Monitor: NOAA-79031307

Abstract: This study and report on the interaction between U.S. port development and coastal management program development deals with the quite recent and still emerging areas of conflict involving port interests and those individuals and groups dedicated to coastal zone protection and noncommercial uses of our limited shoreline resources. A positive approach to methods that can be used to solve problems which have arisen and will continue to do so is presented. A balance can, and inevitably must, be found in order to avoid costly and unnecessary delays in the management of coastal resources. A national perspective on how port authorities and coastal management programs are dealing with one another is presented. Also some recommendations on future direction in these relationships are given for use by the maritime commerce and transportation industry and to coastal planners in state and local government.

Jan 78 178p
Monitor: 18
Prepared by Fay, Spofford and Thorndike, Inc., Boston, MA., and Economics Research Associates, Boston, MA. Prepared for Maine State Planning Office, Augusta. Sponsored in part by National Oceanic and Atmospheric Administration, Washington, DC. Office of Coastal Zone Management.

Abstract: The purpose of this study has been to determine the potential for new or expanded port cargo-handling facilities in Maine. Particular emphasis has been placed on a facility with the capability of handling the wide range of forest products produced in the state. A major impetus for this study was the State's desire to have more of its exports and imports move through Maine's ports, if such movement could be found to be practical and economical. Both engineering and economic considerations have been closely coordinated throughout the course of the study. Existing ports which presently handle general cargo were examined for their suitability as the site for a port development project. Each was evaluated regarding such characteristics as existing cargo facilities, land availability for new or expanded facilities, highway and rail access, depth of water, and availability of other port-related services. These investigations revealed that the Portland and Searsport areas are most suitable as a site for a cargo port development project, whether it be a new or expanded facility.

Descriptors: *Marine terminals, *Maine, Cargo transportation, Marine transportation, Distribution systems, International trade, Harbors, Seaports, Economic surveys, Site surveys

Evaluation of a Domestic Container Feeder Service on the Atlantic and Gulf Coast

Booz-Allen and Hamilton, Inc., Bethesda, MD.*Maritime Administration, Washington, DC. Office of Commercial Development. (408 597)

Final rept.
F1203B2 Fld: 15E, 13J, 85G*, 86L GRAI7914
Feb 79 170p*
Contract: MA-8-3035
Monitor: MA-PD-940-79040

Abstract: The Maritime Administration and Sea-Land Service, Inc., jointly undertook this study of a coastwise shipping service in the U.S. Gulf and East Coasts. The service investigated was one that would have the potential to handle domestic cargo in coastwise movement, and international relay cargo from secondary ports to load center ports. The principal findings were: the potential market for a waterborne feeder system in 1980 will include over 5 million TEU's of containerable international shipments and over 1.6 million TEU's of containerable domestic cargo; competitive factors will limit the market share that a feeder system can obtain; four feeder systems offer the opportunity for high load factors; the candidate feeder systems can capture over 170,000 TEU's of international cargo annually; feeder system costs are generally higher than the overland alternative but, depending upon the specific conditions, can be competitive with a direct call by the line haul vessel; although the legal framework does not encourage the development of feeder systems, it does not prohibit or severely limit them; and the overall impact of the proposed feeder system on the U.S. economy will exceed $475 million over a 20-year span.

Identification and Evaluation of Deepwater Port Hose Inspection Methods

Transportation Systems Center, Cambridge, MA.*Coast Guard, Washington, DC. (407082)

Final rept. Aug 76-Mar 78
AUTHOR: Hathaway, W. T.; Frenkel, L.; Plank, G. R.; Bobo, S. N.
P1162K4 Fld: 13K, 13J, 94, 47 GRAI7914
Jan 79 155p
Rept No: TSC-USCG-79-10
Monitor: USCG-D-02-79

Abstract: The work contained in this report consists of a review of deepwater port hose failures to date, and the causes leading to these failures, as well as an evaluation of current hose inspection techniques and procedures, and an examination of available non-destructive test procedures which are not currently used on deepwater port hoses but show potential in this application. Inspection methods which appear to show potential for immediate application are x-ray inspection for hose component placement, durometer testing for liner hardness, and pressure-volume testing for overall structural characteristics. Those methods judged to require more experimental investigation, both in the laboratory and the field, are ultrasonic inspection and acoustic emission inspection. Included in the report are the results of laboratory tests with acoustic emission, ultrasonic, and durometer techniques and recommendations for further work utilizing these techniques. (Author)

Some Recent Trends in Hull Forms for Merchant Ships

Swedish State Shipbuilding Experimental Tanks, Goteborg. (338 000)
AUTHOR: Williams, Ake
F1125H4 Fld: 13J, 47A GRAI7913
1978 57p
Rept No: ISBN-91-38-04696-2; PUB-80
Monitor: 18
Also pub. as ISSN 0373-4714.

Abstract: Some examples are given of hull form investigations recently carried out by The Swedish State Shipbuilding Experimental Tank (SSPA). Special attention was paid to the qualities of the hull forms with regard to the propulsive performance including propeller cavitation and vibration. Two main categories of merchant ships were selected for closer studies, namely: Large tankers and bulkers (VLCCS/ULCCS) and high-powered container/ro-ro ships. The analysis and conclusions from the investigation seem to justify, for the VLCCS/ULCCS, a forebody of ellipsoidal form and an afterbody of twin-skeg (or twin-gondola) shape, as this combination gives the lowest required shaft horse power. For the high-powered container/ro-ro vessel, where cavitation and vibration problems often occur, an afterbody hull form with 'free space' around the propeller(s) is recommended. The choice of an economic forebody hull form depends strongly on whether a reasonably constant forward draft can be kept.

Errata sheet inserted.

Abstract: This guide includes abstracts of government and privately maintained data bases and publications containing statistical data related to maritime transportation. With a few exceptions, the publications abstracted are periodically reissued or updated. Some organizations that collect data but issue no statistical publications may make them available on request. A listing of some of these organizations has also been provided. The guide is intended to assist the user in identifying data sources. Inclusion does not imply endorsement of the validity of the data nor is it an attempt to solicit customers for the organizations identified. The guide is divided into fourteen broad subject areas: Ports and Terminals; Maritime Economics; Commercial Vessel Construction and Repair, Characteristics, Movements, and Commercial Vessel Casualties, Government Vessel Construction and Repair and Characteristics; Cargo Movements and Trade Routes; Labor and Management--General Employment, Unions and Trade Associations, and Personnel Casualties; Government Personnel; and Inland Waterways.

Descriptors: *Marine transportation, *Statistical data, *Naval vessels, *Information systems, Merchant vessels, Data bases, Directories, Abstracts, Harbors, Marine terminals, Economics, Water traffic, Research ships, United States Government, Shipbuilding, Repair, Routing, Casualties, Inland waterways, United States, Foreign, Labor unions, Industries, Management, Government employees

Rept No: 5615
Contract: MA-7-38009
Monitor: MA-RD-920-79017

Abstract: The report presents the results of a project investigating the commercial availability of equipment and the applicability of COGAS marine power plants for U.S. flag merchant ships. The report is subdivided into four parts and two appendices. Part I includes system optimization studies and a literature search. Various alternatives of steam cycles, heat recovery boiler pressures and efficiencies, steam turbine efficiencies and types of fuel are analyzed. Part II includes the work performed to develop the selected optimum steam cycle into a marine COGAS power plant. Part III is a technical bulletin including the design and performance of the COGAS power plant equipment. Part IV includes economic analyses comparing two U.S. flag ships, a containership and a tanker, fitted with steam and COGAS power plants. Appendix 'A' contains the arrangement of machinery drawings of COGAS installations on a containership and a tanker; and Appendix 'B' the equipment drawings of COGAS power plant components.

Descriptors: *Marine surface propulsion, *Ship turbines, Gas turbines, Steam turbines, Waste heat boilers, Reduction gears, Planetary gears, Systems engineering, Merchant ships, Tanker ships, Cargo ships, Economic analysis

Identifiers: *Combined cycle power plants, Containerships, NTISCOMMA

Evaluation of Liquid Cargo Tank Overpressure

David W Taylor Naval Ship Research and Development Center Bethesda MD Structures Dept (387698)

Final rept.
AUTHOR: Swanek, Richard
F0705J4 Fld: 13J, 47A GPAI7910
Sep 78 80p
Contract: MIPR-Z-70099-6-65865
Monitor: USCG-D-71-78

Abstract: The phenomenon of cargo tank overpressure during transfer operations was analyzed and analytical models describing tank pressure rise during transfer operations were validated with scale model experiments. Factors examined affecting tank pressure were cargo properties, transfer rates, tank characteristics and vent system design. Findings indicate that typical vent systems employed today have adequate capacity for venting gas but inadequate capacity to vent liquid after the tank becomes liquid full. Furthermore, it appears that tank failure is inevitable for the case of liquid overfill unless loading rate(cu-ft per sec) to vent area (sq-ft) ratios are kept below 6ft/sec. Currently, most transfer operations exceed this value with tank failure expected less than one minute after the tank becomes liquid full. A method to evaluate the adequacy of existing cargo tanks against the overpressure hazard is presented. (Author)

Descriptors: *Tanks(Containers), *Cargo vehicles, Liquids, Overpressure, Mathematical models, Transfer, Scale models, Venting, Vapor pressure, Bulkheads, Loads(Forces), Safety

An Assessment of Transportable Breakwaters with Reference to the Container Off-Loading and Transfer System (COTS)

Civil Engineering Lab (Navy) Port Hueneme CA (391111)

Final rept. Feb 77-Jan 78
AUTHOR: Jones, D. B.
P0614K1 Fld: 13B, 15E, 50B GRAI7909
Sep 78 119p
Rept No: CEL-TN-1529
Project: F53536
Task: YF53536091
Monitor: 18

Abstract: A study covering three specific designs for a tethered float breakwater and simple and legged versions of the sloping float (inclined pontoon) breakwater has resulted in improved definition of certain aspects of the logistic burden connected with transportable breakwaters in military operations. Performance data reported for the two types were analyzed in order to determine the transverse cross-section dimensions required for 50% reduction of the significant wave height asscciated with the Pierson-Moskowitz wave spectrum with 7-second peak period. Specific designs with this capability were then examined to assess requirements for overseas transportation, installation, and cost. The state performance requirement was drawn from an analysis of the Container Off-Loading and Transfer System (COTS). This analysis concluded that wave-induced motions of moored lighters, barges, and floating platforms (with natural periods between 2 and 7 seconds) could adversely affect cargo flow rates. Thus, a breakwater effective for 7-second waves could decrease the frequency and duration of occasions when the system is degraded by wave action. Bargeships, ships with well decks, or large ocean-going barges would be required to transport the modules of the various designs for a 7-second breakwater. A LASH bargeship is the most likely carrier for COTS breakwaters. LASH capacity varies from 750 to 3,600 lineal feet of breakwater, depending upon the particular vessel and the breakwater design. For the various points in the COTS where a breakwater would be beneficial, the length of breakwater required varies from 650 to 4,000 feet. (Author)

Descriptors: *Breakwaters, Logistics, Transportable, Floating docks, Performance(Engineering), Pontoons, Floats, Tethering, Cargo handling, Experimental design, Marine terminals

Contract: DO-A01-78-00-3006
Monitor: 18

Abstract: A project was conducted as the first phase of a multi-phase program to develop and demonstrate an automated management control system for public marine terminals. The objectives of the Phase I effort were as follows: Identify the requirements for control of containerized cargo in various categories of public marine terminals; Define a family of concepts for an automated management control system that would satisfy the identified requirements; Develop and apply a methodology for assessing the impact of various automation concepts on terminal financial performance and operational effectiveness; Explore the potential extension of the automation concept beyond the terminal boundaries to permit (1) additional information users, and (2) shared resources, and to Develop a detailed plan for implementing Phase II of the overall program.

Abstract: This report summarizes a 3-part report which (1) analyzes U.S. bulk commodity imports and exports; (2) identifies petroleum as the principal commodity, for which the economy of movement in supersize ships would justify construction of deepwater terminal facilities on the North Atlantic and Gulf Coasts, a requirement for coal and ore is cited but is said to depend on future market trends; (3) identifies transportation costs for supersize tankers, dry bulk carriers, feeder tankers, feeder barges, and pipelines; (4) surveys East, Gulf, and West Coast ports and deepwater sites suitable for deepwater terminal construction; (5) selects five candidate sites and presents a conceptual design for each; (6) compares capital and operating costs as well as total transportation costs of alternative transportation systems; (7) evaluates the benefits and limitations of multi-use terminals; (8) defines specific environmental protection features; and (9) describes requirements for advanced construction methods.

Abstract: Ship tank Electrostatic Model Studies presents experimental electrostatic results from laboratory scale model ship tank washing and liquid sloshing tests using fresh water, seawater and crude oil liquids. Geometric scaling law relationships based on a linear theoretical description of the electrical phenomena are experimentally confirmed to provide potential means for extrapolating laboratory test results to full scale tank enclosures. Electrostatic model study results are summarized to provide general technical guidelines for ship tank design and operational factors related to electrostatic hazard reduction. Electrostatic instrumentation and numerical computer models developed especially for the scale model laboratory tests are described and documented.

Abstract: An experimental study was conducted utilizing scale modeling techniques to establish improved methods for ship tank gas freeing and inerting. Scaling studies were performed to establish appropriate similitude criteria. Parametric studies were undertaken to investigate the effects of tank internal geometries, inlet/outlet configurations and locations, blower flow capacities, and gas densities on the gas exchange process. A comprehensive set of experiments was conducted on six ship tank models which represent extremes in tank geometry for U.S. designed and constructed ships. Design and operational information is presented and techniques to improve the efficiency of gas exchange are recommended for both dilution and displacement methods.

Prepared in cooperation with Hittman Associates Inc., Columbia, MD.

Abstract: This report deals with the description, reliability and rating of oil transfer control systems in Deepwater ports. A typical oil transfer control system is hierarchically defined along with equipment description and purpose, reliability, spill risk, effects of failure and alternative procedures. A numerical rating system is presented which enables the design reviewer to compare a proposed control system with a benchmark system. Equipment Staging Diagram, Fault Trees and a Failure Mode and Effects Analysis are presented for the defined control system to aid in its analysis. (Author)

Tank Barge Oil Pollution Study

Automation Industries Inc Silver Spring Md Vitro Labs Div (408035)

Final rept. Jul 77-Feb 78
AUTHOR: Bender, Avi; Brown, Gerald G. Jr; Rosenbusch, Joseph M.
F0022A2 Fld: 13B, 68D GRAI7901
Feb 78 69p
Contract: DOT-CG-71603-A
Monitor: USCG-CG-M-2-78

Abstract: This study was conducted to determine and categorize the causes of tank barge oil spill incidents and the extent of the resulting pollution. Coast Guard pollution incident data files were reviewed for the 3-year period from 1974-1976, and discussions were held with pollution control and marine safety personnel in four Coast Guard district offices. Operational and causal patterns were identified, present pollution prevention efforts were examined, and means of reducing the spill volumes and number of incidents were investigated. The analysis revealed a preponderance of small oil spills (= or 100 gal) which occur during cargo transfer operations; however, these incidents contributed less than 10% of the total volume spilled. The major spills (100 gal), which occur primarily during underway operations, represented a small portion of the total incidents but contributed the bulk of the oil volume spilled. A number of preventive measures were examined. Improved tankerman training and use of coamings should substantially reduce the number of small spills. Double-hull barge construction should prove effective in preventing many large spills resulting from collisions or groundings. Several other preventive measures were also considered which involve the regulatory area and barge/shore facility interfaces. (Author)

Feb 78 230p
Rept No: TP-7719-1
Contract: DOT-CG-64157-A
Monitor: USCG-D-21-78

Abstract: This report describes a study of mooring load monitoring and prediction systems for deepwater ports. The study considers both the complete systems and the various components of each system. The primary purpose of the study is to define and critically compare all candidate monitoring and prediction systems that might be used at a U.S. deepwater port and to recommend what, if any, systems should be required at such ports. The study is primarily directed to oil import terminals using single point moorings of the Catenary Anchor Leg Mooring (CALM), Single Anchor Leg Mooring (SALM), and tower types, but alongside moorings and lng ports are considered briefly. Factors such as hawser properties, which affect allowable mooring loads, are also considered.

Descriptors: *Mooring, *Marine terminals, Monitoring, Anchors(Marine), Towers, Loads(Forces), Deep water, Measurement, Telemeter systems, Rope, Failure, Predictions, Strain gages, Mooring buoys, Warning systems, Tankers, Petroleum products, Imports, Harbors, Liquefied natural gas

Preliminary Evaluation of Wind and Wave Effects at Potential LNG Terminal Sites, State of California. Appendix B: An Evaluation of the Relative Wave Climate at Six Offshore LNG Sites Considering Island Influences and Topographic Effects

Army Engineer Waterways Experiment Station Vicksburg Miss (038100)

Miscellaneous paper (Final)
AUTHOR: Hales, Lyndell Z.
E2423D4 Fld: 13J, 8C, 47 GRAI7823
Jul 78 453p
Rept No: WES-MP-H-78-2-APP-B
Monitor: 18
Appendix B to Rept. no. WES-MP-H-78-2 dated Jan 78, AD-A049 883. See also Appendix A, AD-A054 130.

Abstract: This Station (WES) was requested to assist in the preliminary evaluation of the wave climate at alternate potential Liquefied Natural Gas (LNG) terminal sites by applying existing hindcast wave data of a general nature to obtain estimates of the times of excessive wave conditions at the various sites. After the preliminary evaluation was completed, WES was again requested to assist by analyzing the effects of island sheltering and topographic influences on the wave climates of six offshore sites in order to provide a more refined estimate of the wave conditions existing at the potential sites. Because of the absence of a comprehensive deepwater wave hindcast data base of sufficient degree of confidence to permit estimates of the absolute magnitude of occurrences of waves of different periods and heights, the analysis conducted is a relative evaluation only and should not be interpreted as projections of actual downtime, but rather as a consistently uniform basis for comparison. When the appropriate topographic coefficients had been applied to the deepwater hindcast wave data and the resulting wave climate at the potential offshore LNG site had been obtained, it was required that the effects of this resultant wave climate be determined on four possible terminal concepts at each of the six sites. These four concepts include: (a) fixed terminal with one pier, (b) fixed terminal with two piers, (c) floating barge, and (d) deepwater mooring tower.

Descriptors: *Marine terminals, *Site selection, *Ocean waves, Height, Probability, Wind velocity, Climate, Santa Barbara Islands, Topography, Offshore, Deep water, Peak values, Refraction, Oceanographic data, Seasonal variations, Piers, Floating bases, Barges, Towers, Mooring, Tankers, Ship motion, Liquefied natural gas, Legislation, California, Coastal regions

Abstract: Using the main scantlings for a 600,000 ton nuclear tanker and curves of weight per foot including steel outfit machinery and deadweight items developed by Newport News Shipbuilding, the vessel was divided into 20 sections with half stations at the ends. Cross sectional area, mass, moment of inertia and virtual mass were calculated at each section. Additional properties required for the virtical, horizontal and combined torsional-horizontal bending modes of vibration were calculated. These properties were calculated for both the ballast and full load conditions, and are used as input data to the General Bending Response Program as described in Volume I.

Descriptors: *Nuclear powered ships, *Tankers, *Collision research, Vibration, Acceleration, Bending moments, Transient response, Computer applications

See also Volume 2 dated 3 May 78, PB-283 212.

Abstract: Using methods of forced vibration analysis, calculations of impact accelerations were carried out in way of the reactor space of a 600,000 ton nuclear tanker when struck by another ship in the area of the collision barrier. The General Bending Response Program was used by representing the ship as an elastically coupled non-uniform beam-spring model subject to a Fourier series representation of the transient force of impact. Sectional properties were developed for the ship in both ballast and full load conditions in order to describe the model. Sensitivity calculations were made for variations in loading conditions, ship-hull damping, impact duration and impact magnitude for the lateral mode of vibration. An additional calculation was made for the combined torsional-horizontal bending mode of vibration.

Descriptors: *Nuclear powered ships, *Tankers, *Collision research, Vibration, Acceleration, Bending moments, Transient response, Computer applications

1977 111p
Rept No: OCS/TM-2
Monitor: 18
Prepared in cooperation with New England River Basins Commission, Boston, Mass. and Alaska Consultants, Inc., Anchorage. Sponsored in part by National Oceanic and Atmospheric Administration, Washington, D.C. Office of Coastal Zone Management.

Abstract: In January 1978, the U.S. Department of the Interior will sell leases allowing drilling for oil and gas in an area of the North Atlantic called Georges Bank, which is approximately 200 miles south east of Maine. The first onshore facilities established to support offshore drilling operations are Service Bases, which serve as the logistical link between onshore suppliers and offshore operations. This report provides a detailed description of the modern Service Base, its characteristics, requirements, and potential impacts. It should be remembered that it is not at all certain where in Maine Service Bases would locate, or even if Services Bases will be located in Maine at all. The State Planning Office report, Maine and the Search for OCS Oil and Gas, discusses in more detail the factors which affect the siting of Service Bases and other onshore facilities associated with OCS.

Descriptors: *Offshore drilling, *Oil wells, *Natural gas wells, *Marine terminals, Management planning, Logistics services, Facilities management, Harbor facilities, Land use, Manpower, Georges Bank, Maine

Prepared in cooperation with Science Applications, Inc., Santa Ana, CA.

Abstract: The Deepwater Ports Act of 1974 gives the Secretary of the Department of Transportation and, by delegation, the U.S. Coast Guard, specific authority to regulate the design, construction and operation of Deep Water Ports (DWPs) off the coast of the United States. Some of the regulations deal with safety and prevention of oil pollution. This study is one of several providing information for future regulations dealing with pollution. It identifies and assesses inspection methods and procedures for the Oil Transfer System (OTS) of DWPs. Recommendations are made for inspection methods and procedures that would provide an effective means of minimizing accidental oil spills from the OTS of DWPs in U.S. waters. The recommendations were based primarily on a cost-effectiveness analysis for both commonly used and technologically advanced inspection methods and procedures that were considered to provide the best available technology for DWPs in U.S. waters. Inspection methods considered apply primarily to the components of the OTS, onsite, during normal operations and also to components of other systems whose failure could affect the integrity of the OTS. Failure of components and subsystems of the OTS, which contributed most significantly to the risk of oil spills, were identified in a system safety analysis. (Author)

Prepared in cooperation with Resource Planning Associates, Cambridge, Mass.

Abstract: This study summarizes historical and current LPG trade and vessels operating worldwide. It also forecasts LPG trade required for the U.S. and other major markets through 1990. Using an economic model to assess the market for LPG ships, the study forecasts vessel requirements for U.S. LPG trade and prospects for building required vessels in the U.S.

Also available in set of 9 reports PC E20, PB-281 441-SET.

Abstract: The regulatory framework related to Outer Continental Shelf (OCS) developments and impacts is analyzed; the laws governing offshore developments are enumerated; the regulatory framework controlling inshore and onshore buildup in support of OCS development is described. Part 1 reviews the organizational structure and program of the U.S. Fish and Wildlife Service. Part 2 discusses OCS oil and gas leasing procedures, stipulations and permits for tracts under Federal jurisdiction. Part 3 describes the permit review process for nearshore and onshore developments such as pipelines, platform construction yards and service bases.

13 Mar 78 36p
Rept No: GGS-5612-4
Contract: MA-7-38028
Monitor: MA-RD-920-78041

Abstract: A previous sinking test performed in 1971 in Hamburg, Germany was translated, and studied. It is appended. It is recommended that the test model be made only for the stern of the tanker and be made of transparent plastic so as to monitor the entrapped air; it is also recommended that the velocity and attitude of the sinking model be recorded only by camera. A list of U.S. Model tanks suitable for this test and a rough cost estimate are given.

Descriptors: *Tanker ships, *Submerging, Ship hulls, Flooding, Model tests, Model basins

Palau: Native Paradise or Petroleum Superport

University of Southern California, Los Angeles. Inst. of Marine and Coastal Studies.*National Oceanic and Atmospheric Administration, Rockville, Md. Office of Sea Grant.
AUTHOR: Soule, Dorothy F.
E1474L4 Fld: 13B, 10A, 97R, 68, 86M GRAI7815
1977 7p
Rept No: USCSG-R-02-78
Monitor: NOAA-78041208
Pub. in Oceans 77 Proceedings, p5D1-5D6 1977.

Abstract: Numerous environmental groups, scientists and humanists have gone on record concerning that incomparable biological resource, the coral reefs and limestone islands of Palau. The Trust Territory, which governs Micronesia, is due to be dissolved in 1981 but there is little economic base for independence. Its strategic location, remoteness and low population have led to Palau as a potential site for superport development. International politics, secrecy, spying and rumored pay-offs seemed to leave Palauans virtually without a voice in the decision making.

Descriptors: *Palau Islands, Cultural geography, Culture(Social Sciences), History, Geography, Land use, Petroleum industry, Social effect, Environmental impacts, Scenarios

Potential for Deepwater Port Development in the United States

General Accounting Office, Washington, D.C. Energy and Minerals Div.

Report to the Congress.
E1463F3 Fld: 13B, 47*, 85G*, 85E GRAI7815
5 Apr 78 75p*
Rept No: EMD-78-9
Monitor: 18

Abstract: The economic and environmental advantages generally associated with deepwater ports and the expected continued U.S. reliance on large quantities of imported oil suggest that the development of a mid-Atlantic deepwater port may be in the national interest. It deserves attention at this time. Industry is planning to construct and operate deepwater ports off Louisiana and Texas. GAO recommends that the Secretary of Transportation complete a study of the cost-effectiveness and feasibility of a mid-Atlantic deepwater port by December 31, 1978. The Secretary should also submit to the Congress a plan for the port's development unless the study finds that some other option is more desirable.

Abstract: This report complements research on the economic impact of a superport in southwest Louisiana. While area citizens have enjoyed the benefits of the oil and gas resources and the associated economic stimulus provided, this same progress has resulted in a variety of problems. Among these are the increased demand for public services as well as environmental degradation. The study inventories the obvious economic impacts in relation to offshore activity and presents the acquired data as a resource tool for planners.

Sep 77 309p
Rept No: EXXON/EE-17E-T77
Contract: DOT-CG-62451-A
Monitor: USCG-D-49-77

Abstract: This report provides guidelines for the establishing of design mooring loads for SPMs (single point moorings) and for the design of mooring components of SPMs. It first discusses the manners in which waves, winds, current, the tanker, and the mooring system influence mooring loads. It then describes how mooring loads should be determined through model testing and statistical analysis. Next, it discusses how the arrangement and strength of mooring fittings on tankers may limit the maximum allowable mooring loads. The report then discusses the properties of the synthetic ropes normally used as mooring hawsers and recommends factors of safety for SPM hawsers. It also discusses the rules and standards which should be used for mooring structures, anchor chains, bases, and piles. Next, the report discusses synthetic-rope testing and field inspection. The report ends with recommendations for further investigation of large-diameter synthetic rope properties, testing, and inspection. The report contains an extensive glossary of SPM terminology and a bibliography of other reports and articles in the field of SPMs. (Author)

Preliminary Evaluation of Wind and Wave Effects at Potential LNG Terminal Sites, State of California

Army Engineer Waterways Experiment Station Vicksburg Miss (038100)

Final rept.
AUTHOR: Hales, Lyndell Z.
EC781G4 Fld: 13J, 13B, 21D, 47, 50B GRAI7809
Jan 78 236p
Rept No: WES-MP-H-78-2
Monitor: 18

Abstract: The California Legislature decreed that the California Coastal Commission had until 1 February 1978 to identify, evaluate, and rank alternate potential Liquefied Natural Gas (LNG) Terminal sites on the California coast. Because of the Corps' experience in various aspects of such studies, the U. S. Army Engineer Waterways Experiment Station was requested by the Coastal Commission to assist, particularly in the use of existing hindcast data to evaluate possible effects of wind and waves on the docking and unloading of a LNG tanker. The effect of wind and wave climate was relatively evaluated at 26 potential LNG terminal sites along the coast of California. The analysis did not apply wave refraction theory at any of the sites, so the absolute magnitudes of the values obtained at each site are subject to refinement. The computations which were performed were optimized on a site-specific basis; i.e., they have been determined by utilizing the situations unique to that one particular location, and the results should not be extrapolated far beyond the respective site, if at all.

Tank Vessels and Marine Terminal Facilities for Oil and Liquified Natural Gas: A Selected Bibliography

Alaska State Dept. of Environmental Conservation, Juneau.
E0511L1 Fld: 13J, 47* GRAI7806
Aug 77 278p*
Monitor: 18

Abstract: Early in 1977 the Alaska Department of Environmental Conservation began developing a comprehensive bibliography on tank vessels and marine oil terminal facilities. This began in conjunction with a new departmental program charged with regulating tankers and oil terminals operating in the state. Topics include oil and liquified natural gas (LNG) tank vessels, oil and LNG marine terminals and offshore facilities and deep water ports. State and federal legislation dealing with tankers and terminals, marine insurance and pollution funds and oil pollution resulting from oil related marine operations are some of the other subjects covered in this bibliography.

Abstract: This report consists of ten working papers prepared as background material for the assessment of the effects of three proposed offshore energy systems on the coastal areas of New Jersey and Delaware. The three proposed offshore energy systems are: exploration for and development of offshore oil and gas, deepwater ports for supertankers, and floating nuclear powerplants. The 10 working papers cover: federal and state regulation of the three systems, the biological impacts, the risk of oil spills in developing oil and gas resources and operating deepwater ports, the air and water quality impacts, regional energy supply and demand considerations, the fiscal effects of developing the three systems, environmental studies, a safety analysis of floating nuclear powerplants, an analysis of fuel and waste handling of floating nuclear powerplants, and an analysis of the economic considerations of floating nuclear powerplants. Monitor: MA-RD-920-77092
Supersedes NUS-1548.

Abstract: Various ship accidents which have the potential of causing damage to the nuclear power systems of the nuclear powered Ultra Large Crude Carrier (ULCC) are identified. For each ship accident, an event tree is developed which shows the possible causal relationship between ship accident and derangement of nuclear safety-related systems. System state diagrams are developed which define the degree of availability of each safety-related system. As an example of the use of the methodology, availability state tables are derived for each safety-related system for all potential results of a collision accident. Further, an analytic set of probability equations are derived relating the probability of loss-of-function, either partial or complete, of the low pressure safety injection system to the various consequences of a collision.

Liquefied Natural Gas: Safety Issues, Public Concerns, and Decision Making

Harvard Univ., Cambridge, Mass. Energy and Environmental Policy Center.*Energy Research and Development Administration. (9504298)
AUTHOR: Van Horn, A. J.; Wilson, R.
D3831I4 Fld: 10A, 21D, 97K, 97R, 68 GRAI7726
Nov 76 131p
Contract: EY-76-C-02-0016
Monitor: 18
Microfiche copies only.

Abstract: Natural gas is an important, widely used fossil fuel which is convenient and relatively non-polluting. Because U.S. domestic suppliers have been declining since 1972, suppliers have sought to import additional gas in the form of liquefied natural gas (LNG), which is 1/600 the volume of natural gas and is therefore convenient for transportation and storage. If present plans and proposals pending approval are implemented, there will be a rapid increase in the use of liquefied natural gas in the United States. The facilities required include liquefaction plants, large ocean-going tankers, import-receiving terminals, storage depots, and gas-transmission pipelines. A description is presented of the risks and impacts presented by LNG operations in the near future. The safety issues are summarized and the origins of public concern in two LNG facilities siting disputes are examined. Some of the important criteria that need to be evaluated for responsible decision making are suggested. On balance, the overall risks of LNG supply systems are probably less than those of some energy systems now in use. Nevertheless, continued attention to the potential risks is needed to ensure that this remains true. (ERA citation 02:045014)

The Alaskan Oil Disposition Study: Potential Air Quality Impact of a Major Off-Loading Terminal in the Pacific Northwest

Environmental Protection Agency, Seattle, Wash. Region X.
AUTHOR: Bray, David C.
D3533I2 Fld: 13B, 10A, 97R, 68A GRAI7723
Mar 77 123p
Rept No: EPA/910/9-77/044
Monitor: 18

Abstract: This study evaluates the air quality impact of a marine oil transfer terminal for Alaskan oil. It includes an evaluation of specified sites with regard to present emissions and air quality; the determination of the potential emissions associated with a major crude oil offloading facility; and a preliminary modeling analysis to assess the potential air quality problems which might be associated with the operation of such a port.

Paper copy also available in set of 5 reports PC E17, PB-269 722-SET.

Abstract: The study extended over a period of approximately six months. The principal objectives of the study were to develop the preliminary design for a 600,000 DWT nuclear powered ULCC, perform ship safety analyses, develop a preliminary quality assurance program, develop a ship construction schedule of key events, develop the shipyard/reactor manufacturer scope of supply, define the interfaces specifically related to the nuclear propulsion plant. In terms of budgetary estimates, an economic evaluation was performed for ship construction cost, ship refueling and drydocking cost, first of a kind ship construction cost, ship manning cost, and contingencies.

Rept No: NUS-1843
Contract: MA-T-38160
Project: MA-163-601
Monitor: MA-RD-920-77094

Abstract: This study presents a cost/benefit analysis for the utilization of uranium in merchant ships versus the use of uranium for the generation of electricity in central power stations. The study concludes that an alternative naval fuel to oil must be developed for the merchant marine to reduce U.S. dependency upon foreign supplies of a critical fuel. The study further indicates that use of uranium for ship propulsion results in transport of large quantities of needed import/exports while the residual oil saved will generate the same quantity of electricity in a central power station as the uranium used for ship propulsion.

Environmental Impact Analysis of the Nuclear Merchant Ship Program-Addendum

NUS Corp., Rockville, Md.*Maritime Administration, Washington, D.C. Office of Advanced Ship Development.

Special study
D3151A1 Fld: 13B, 21F, 13J, 68D, 81I, 47A, 68F GRAI7720
Jun 77 130p
Rept No: NUS-1926
Contract: MA-T-38160
Project: MA-163-602
Monitor: MA-RD-920-77093

Abstract: This study represents a qualitative extension of an earlier Environmental Impact Analysis of the Nuclear Merchant Ship Program (MarAd, 1975) using an Ultra Large Crude Carrier (ULCC) as the reference ship, to other types of ships including a containership, dry-bulk cargo vessel, and an icebreaking oil tanker. This qualitative analysis shows that, for ships operating into coastal ports (containerships and possibly dry-bulk carriers), both ecological and radiological impacts would be somewhat greater than for the reference ULCC docking at an offshore terminal. These impacts can be kept within the guidelines established for land based nuclear power plants by implementation of appropriate operating procedures.

Marine Service Bases for Offshore Oil Development

Alaska Consultants, Inc., Anchorage.**Alaska State Dept. of Community and Regional Affairs, Juneau. Div. of Community Planning.*National Oceanic and Atmospheric Administration, Washington, D.C. Office of Coastal Zone Management.
D2971D2 Fld: 5A, 13J, 15E, 94C, 97 GRAI7718
Jul 76 94p
Monitor: 18
Sponsored in part by Alaska State Dept. of Community and Regional Affairs, Juneau. Div. of Community Planning.

Abstract: This report is a continuation of special studies the Division of Community Planning is undertaking on various critical issues of common interest to Federal and State agencies, and affected local governments. Marine service bases will be an integral part of any OCS development along the Alaskan coastline. They will often be sophisticated staging areas, operating around the clock, providing drilling materials and support equipment from the coast to the offshore fields. While size and function will vary with offshore activity, the marine service base will remain the longest lived of any activity related to OCS development. Marine bases carefully conceived and efficiently operated can make positive contributions to a community's economic diversification and stability. Poorly planned facilities can, conversely, be detrimental to a community's interests, and cause negative onshore impacts associated with OCS development. This study should serve as a guide for ensuring the compatability of service bases with local and regional needs.

Conference on environmental oceanography in the Gulf of Mexico, College Station, Texas, United States of America (USA), 15 Mar 1976.

Abstract: A workshop was convened under the sponsorship of the Energy Research and Development Administration to define the most critical energy-related environmental problems in the Gulf of Mexico and develop the framework for a program of research to solve these problems. A major and immediate concern is activity related to the oil and gas industry: production, transportation (including potential superport construction), processing, and use of petroleum-derived fuels. The problems which might be posed by the development of other potential sources of energy, such as coastal and offshore nuclear power plants, were also given consideration. Several keynote speakers presented their thoughts on Gulf environmental problems from different points of view, and their remarks are recorded in Appendix I. (ERA citation 02:023324)

Monitor: NOAA-77032907

Abstract: The National Ocean Survey Coast Pilots are a series of eight nautical books that cover a wide variety of information important to navigators of United States coastal and intracoastal waters. Most of this book information cannot be shown graphically on the standard nautical charts and is not readily available elsewhere. Coast Pilot subjects include navigation regulations, outstanding landmarks, channel and anchorage peculiarities, dangers, weather, ice, freshets, routes, pilotage, and port facilities. This volume of Coast Pilot 9, cancels the Seventh (October 1964) Edition and contains specific information on Cape Spencer to Beaufort Sea, Cape Spencer to Cook Inlet, Kodiak Island, Alaska Peninsula, Aleutian Islands, Bering Sea and Arctic Ocean.

Descriptors: *Inland waterways, *Navigation, *Coasts, *North Pacific Ocean, *Arctic Ocean, *Alaska, Oceancgraphic surveys, Navigational aids, Sea ice, Regulations, Ocean tides, Marine terminals, Channels(Waterways), Meteorological data, Harbor facilities, Beaufort Sea, Bering Sea, Hazards, Anchorages, Aleutian Islands

Influence of Ship Size, Afterbody Shape and Propeller Speed of Rotation on Propeller Performance

Swedish State Shipbuilding Experimental Tank, Goteborg. (338 000)
Dyne, Gilbert
D2233B4 Fld: 13J, 20D, 47A GRAI7712
1977 32p
Rept No: Pub-79
Monitor: 18

Abstract: The influence of ship size, afterbody shape and propeller rate of revolution on the propulsion, cavitation and pressure fluctuation properties of a full-formed tanker was studied at SSPA in 1971-72. The shaft power and propeller rpm were first predicted from resistance, self propulsion and open water tests with 7 m long models in the towing tank. The same models were then tested in SSPA large cavitation tunnel where the wake was measured, the flow around the stern and the cavitation patterns were observed and the vibratory pressures at the hull above the propeller were recorded and analyzed.

Abstract: Statistics for casualties to ships over 2000 gross tons are given for 1975 and added, in the case of collisions, to previous statistics fcr the years 1964-1974, so as to give collision-derived casualties. These are differentiated fcr tanker and non-tanker types, and depending on whether the ship was the struck or striking vessel. The main findings are that about one-fifth cf struck ncn-tankers sink as the result cf a collision, and about one-third cf struck tankers catch fire or explode.

Abstract: A hybrid finite element numerical model was used to calculate harbor resonance for the Pier J completion and tanker terminal project of Long Beach Harbor with no landfill. The numerical model calculates harbor oscillation for harbors of arbitrary shape and variable depth. A finite element grid which covered the immediate vicinity of the breakwater-protected tanker terminal area was used to calculate the response of this area to incident waves with periods from 30 sec to approximately 6 min. Abstract: The stern section of a mcdern merchant ship, built with machinery and deckhcuse aft, is the most labor and capital intensive portion of a ship's ccnstructicn. This study analyzed the feasibility of standardizing the design and construction of this pcrtion of a ship, for application tc a wide variety of merchant ship types, as a means of improving ccmmercial shipbuilding producibility. The concept permits one to obtain the advantages of multiple ship production (lower construction ccst and shcrter ccnstruction time), without restricting a prospective ship owner's flexibility in tailcring the overall vessel design to carry his particular cargo, and meet his requirements for payload capacity, cargo handling capabilities, and ship performance. The study found that the standardized stern concept is both technically sound and ecconomically feasible, and that three basic stern units would be able tc be used tc satisfy 79% of all forecasted U.S. new building requirements to the end of the century. Mcrecver, with a production run of sixteen units, standardizaticn of the stern unit would save a minimum of 7% of all the total cost of the stern. This savings cculd approach 20% if additional measures were taken to enhance producibility, such as the optimization of material flow patterns in individual yards and the use of more labor efficient materials and techniques.

Abstract: This report estimates the benefits and cost that would occur to the citizens of North Carolina if a large-scale development of petroleum industry occurred in the Coastal Plains of the state. This development would include refineries, petrochemical plants, storage and transportation facilities, and an offshore, deepwater terminal. The benefits and cost were considered in economic, social and environmental terms.

Jun 76 146p
Rept No: TSC-USCG-76-2
Mcnitcr: USCG-D-69-76

Abstract: This report deals with the risk analysis methodclcgy for oil spills from the cil transfer systems in deepwater ports. Failure mcde and effect analysis in combination with fault tree analysis are identified as the methods best suited for the assessment cf comparative risk frcm different technical alternatives. The necessary methcdology and analytical expressicns are developed and their application is demonstrated in some general sample calculations. Basic data scurces are listed, and the quality cf the data is discussed. It is shown that the available data are nct sufficiently ccmplete for quantitative calculaticns of the risk for the entire system. Ccmparative calculaticns, however, can be made, and a systematic qualitative examinaticn cf the system is pcssible.

Project: NBS-2752430
Monitor: 18
Pub. in Welding Jnl., v55 n5 p387-393 May 76. Prepared in cooperation with Maritime Administration, Washington, D.C.

Abstract: The ship steels, welding practices and weldment toughness requirements applicable to low temperature (to -46 C) regions of liquefied-natural-gas (LNG) tankers are reviewed. In the construction of LNG ships, the principal welding productivity problem is the low deposition rate associated with the low heat input welding practices required to provide sufficient toughness in the weld heat-affected-zone (HAZ). A potential solution to this problem is to use improved steels which can be welded using efficient procedures and still provide satisfactory HAZ toughness. The steelmaking practices that contribute to low temperature toughness are reviewed with respect to economic limitations associated with ship steels and to their potential for improving HAZ toughness.

Tamura, Kinya
C6482G4 Fld: 13J, 20D, 47A, 46B GRAI7612
Feb 76 16p
Rept No: MTB-103
Monitor: 18

Abstract: The model-ship correlation method applied in the Nagasaki Experimental Tank, MHI and its historical background are described. The method, which belongs to the category of theoretical methods, has been used for speed and power prediction of various kinds of ships during these twenty years. The difficulty in power prediction caused by the rapid expansion in size and block coefficient has been overcome by the introduction of a three-dimensional extrapolation method in place of the two-dimensional one, without making any serious misleading prediction. For the current high block ships, it is essential to distinguish the type of flow pattern, around the stern of the model since two kinds of flow pattern exist. The method used to distinguish the flow in model and its influence on model-ship correlation are discussed.

ABSTRACT: Measurements of ambient noise levels made during a time period when a supertanker passed the observation site clearly show such vessels to be a strong acoustic source. The tonals associated with the propeller blade rate and its frequency harmonics were clearly observed on single, omni-directional hydrophones for ranges out to 240 nautical miles. The received signals from the radiated noise from this vessel increased in level by as much as 10 dB when it was in the vicinity of a seamount and the continental slope, suggesting a reflection enhancement. The magnitude of this observed reflection enhancement varies inversely with hydrophone depth, being the largest for the shallowest depth. (Author)

ABSTRACT: This report documents the method that will be used by the Coast Guard to consider navigational safety and environmental factors in defining a 'Safety Zone' around a deepwater port. The methodology has been developed in response to Section 10(d) of the Deepwater Port Act of 1974 (Public Law 93-627) and in consideration of regulations pursuant thereto (33 CFR 150, Subpart C). The report also lists the various types of data required for the determination of a safety zone using the method described, and suggests appropriate formats for data presentation. Thus, in addition to providing a checklist for the application of the methodology, the specified data requirements could be used as guidelines by prospective deepwater port license applicants.

Pub. in William and Mary Law Review, v16 n4 p747-772 1975.

ABSTRACT: The article deals with four legal cases which show different aspects of Federal-State relationships. Each of these cases are documented examples of alternative roles for states to play in coastal resource decision making. The cases deal specifically with the Trident nuclear submarine base to be built in Bangor, Washington, the proposed lease-sale of outer continental shelf areas off of Southern California for oil wells, the deepwater port proposed for Louisiana, and participation in offshore leasing of and profit sharing from oil and gas operations. Each of these cases are discussed in depth. The author concludes from his study that the problems involved will not be resolved while both the Federal and State governments have sovereign power over the same land, and he suggests that both governments articulate their policies and cooperate in the administration of coastal resources.

ABSTRACT: Predictions of the movement of oil slicks and their impact locations along the shoreline of New Jersey and Delaware were determined for two potential deepwater ports and two potential drilling sites. A hydrodynamical-numerical model for the New York Bight area was coupled with a wind generating model to produce temporal patterns of concentration of oil. Shoreline impact determinations were made for the four spill sites for the average winter storm conditions and average summer high pressure systems generated by the models.

ABSTRACT: The report studies existing law which pertains to planning and establishing deep water or off-shore ports. This problem of accomplishing effective and safe use of a vital complex of marine resources arrays the forces for energy development against those of the ecological conservationists. This report examines the several sources of law which bear upon this law of the sea problem. The international commitments of the United States, both customary and conventional, must be taken into account. A second vital source of applicable law is the Federal Government, both from acts of Congress and Federal court decisions. The continuous interaction between federal and state laws, and the need for their coordination, in deep water port development is pointed out by this study. Several existing North Carolina state statutes which apply to deep water ports are discussed in some detail and the involvement of local governmental authorities is also considered.

ABSTRACT: The impact of the energy crisis, embargoes and environmental concerns of transportation of crude oil and petroleum products to potential offshore receiving terminals is ascertained. As the proposed refinery construction programs are directly related to offshore terminal construction, the import of the various refinery construction programs on offshore terminals and the movement of produce by product tankers is also analyzed. The various ports on the three coasts are analyzed with respect to sizes of tankers that may be accommodated and a vessel mix is developed. From this mix and the forecast petroleum demand, tanker movement requirements are estimated. These estimates are used to develop four arrival matrices for 1980 and for 1985--for PAD I and PAD III. Three arrival matrices are developed for PAD V over the same period. From these matrices based on assumed enforcement of the 1973 IMCO Convention, the quantities of oily wastes likely to arrive at given ports on the three seacoasts are estimated.

ABSTRACT: This report presents the results of a study on the performance and operational requirements for an oil barrier to be used at several possible deep water port sites, Four types of barriers were investigated as follows: (1) pneumatic barrier, (2) skirt barrier, raisable, (3) skirt barrier, fixed flotation, and (4) skirt/pneumatic barrier (hybrid type). An engineering review of the four barrier designs is conducted and a program for their experimental evaluation is developed. The evaluation program provides for three levels of tests over a 3-year period: Containment/removal concept tests, dynamic model and component tests and offshore tests of a prototype barrier.

DESCRIPTORS: *Water pollution, *Marine terminals, Barriers, Offshore structures, Terminal facilities, Tests, Oils

MONITOR: CERC-MP-4-75

ABSTRACT: The study attempts to arrive at a satisfactory method of providing a prompt and efficient answer to the fast-growing need for deep-draft berthing facilities along the U.S. east coast. The general concept of large hollow precast floating units towed to the site, and sunk into position lends itself particularly to using the hollow interiors as storage space for liquid bulk cargo in large quantities. Since the trend for more economical transportation of petroleum products is by use of large deep-draft carriers, the combination breakwater-oil storage system is a possible solution. Assumptions were made as to probable site conditions, i.e., water depths, sea conditions, bottom conditions, and a preliminary design developed for the units. Various construction procedures were studied and compared from both technical and construction cost aspects.

DESCRIPTORS: *Breakwaters, *Facilities, *Marine terminals, Offshore, Deep water, Ocean waves, Construction, Prefabrication, Costs

ABSTRACT: The purpose of this report is to briefly describe the biological condition of the deepwater portion of lower Delaware Bay. To accomplish this, it was necessary to examine many scientific sources, thus providing a review of research in the marine biology of the area. Deep water as used in this report refers to subtidal portions of the Delaware Bay region. Lower Delaware Bay refers to the area from the Chesapeake-Delaware Canal to the mouth of the bay and adjacent coastal waters. The main emphasis is placed on the area from Woodland Beach to the mouth of the bay. The report is divided into three main sections: Description of the biology of the area, description of man's activities on the biology of the area, and problems for future research.

DESCRIPTORS: *Aquatic biology, *Delaware Bay, Deep water terminals, Industrial wastes, Sewage, Dredging, Spoil, Waste disposal, Marine fishes, Thermal pollution, Refineries, Plankton, Shellfish, Invertebrates

ABSTRACT: The report draws largely from published materials to review the environmental problems associated with a deepwater port in the Delaware Bay area. The general description includes site locations and proposed facilities, geological setting, physical environment, and biological environment. The effect of construction and maintenance is concerned with a proposed 20-mile site, 8-mile site, Cape May site, and Big Stone Beach site, and the impact on Phytoplankton, Zooplankton, Finfish, and Benthos. The effect of oil spills is concerned with fate of oil spill, environmental effects of dry bulk commodities, and secondary effects. References are cited.

Current Record Analysis and Tidal Computations for Port Valdez, Alaska

Alaska Univ., College. Inst. of Marine Science.*National Oceanic and Atmospheric Administration, Rockville, Md. Office of Sea Grant. (405 785)
AUTHOR: Mungall, J. C. H.
C4374G3 FLD: 08C, 08J, 47B, 86M USGRDR7509
Nov 73 78p
REPT NO: IMS-R73-5, Sea Grant-73-6
GRANT: NOAA-04-3-158-41
MONITOR: NOAA-75012401

ABSTRACT: The fjord of Port Valdez is the innermost of several bodies of water that lie between the Gulf of Alaska and the town of Valdez. The dimensions of the fjord are about 3 miles by 12 miles, with the major axis lying East-West. The entrance, Valdez Narrows, is less than one mile wide. The major current constituent at the entrance is that associated with the M2 tide. By the tidal model the computed current amplitude for the entrance was 11 cm/sec. The drift currents encountered during the two series of observations were considerable, with maximum values of around 5 cm/sec. The chief results of the numerical tidal model study are clearly shown. No phase change occurred in the M2 constituent over the region, and no change in the amplitude of the M2 constituent was found. These results were expected due to the standing wave nature of the tides. The tidal current prediction charts allow one to predict currents for any point at any time.

DESCRIPTORS: *Ocean currents, *Ocean tides, *Oceanographic data, Bathymetry, Inlets(Waterways), Fjords, Mathematical models, Predictions, Alaska Gulf, Marine terminals

Identification of Costs to States to Perform Certain Marine Environmental Protection Functions

Naval Postgraduate School Monterey Calif (251450)

Master's thesis
AUTHOR: Smith, Rodney Ellwood
C4191J2 FLD: 13B, 68D USGRDR7507
Dec 74 174p
MONITOR: 18

ABSTRACT: This study addresses the U.S. Coast Guard's role in marine environmental protection and costs to states of assuming two Coast Guard marine environmental protection functions, oil spill investigation and cleanup. U.S. Coast Guard data for eight West Coast port areas have been used to perform regression and other analyses to relate pollution sources and causes to the number of oil spills occurring in an area. The number of spills then are linked to costs of investigation and cleanup within that area. Other considerations relating to state assumption of marine environmental protection functions are outlined. A grant-in-aid program may be established by the Coast Guard to induce state participation. A possible fund allocation formula is presented. It is based on maintaining the present level of cost-effectiveness for the program.

MONITOR: NOAA-74120903

ABSTRACT: The report provides data and recommendations for use in the design of an Environmental Protection Plan in considering Louisiana superport development. Information is given on the environment, site selection, guidelines for design, construction and operation of superports and related activities. Attention is called to authority funding and compensatory projects and the legal requirements of governmental agencies. It is suggested that the major environmental stresses that may result from superport development are (1) oil or other material spills, (2) construction and operational damages, and (3) ancillary development. Regional planning based on preliminary estimates of this ratio, must begin now or the gradual environmental deterioration of coastal Louisiana will be a high probability.

Dear Customer:

After January 1, 1977, NTIS began indicating a simple price code in bibliographic citations instead of a dollar price. The price codes indicated in NTISearches can be converted to dollar amounts using the price list given on the reverse of this page.

You will note the price list is divided into three sections:

Standard Priced Documents and Microfiche
Exception Priced Documents and Microfiche
Computer Products (Magnetic Tape)

As an example, if a citation indicates a price code A09 then the document is a standard priced item and will cost $12.00.

Many citations will not include price codes for quite some time. We would, therefore, like to give you some guidelines to assist in determining the correct price for those citations not including a price code.

(1) If a paper copy price code is not indicated, find the page count in the citation and look up the corresponding page range in the Standard Price Schedule, then pay the price indicated.

(2) If the paper copy price printed in the citation is higher than the price indicated in the Standard Price Schedule, then pay the price printed in the citation.

(3) Most microfiche are available for $3.50. If the microfiche price printed in the citation is higher than $3.50, then pay the price printed in the citation.

(4) For Computer Products (Magnetic Tape) contact NTIS for a price quote.

We hope this price list and guidelines for its use will be helpful during this interim period when both price codes and non-current prices appear in the on-line searches. If you have any questions, do not hesitate to telephone NTIS Customer Sales, (703) 557 4650.

Management of a Seaport

National Maritime Research Center-Kings Point, N.Y.*Maritime Administration, Washington, D.C.

Final rept.
AUTHOR: Schwimmer, Martin J., Amundsen, Paul A.
C3981D2 FLD: 13J, 05A, 47A*, 70B*, 86L USGRDR7503
1973 612p*
REPT NO: NMRC-KP-114
MONITOR: MA-RD-900-75025

ABSTRACT: Despite the numerous advances made in the field of management science and the many texts written about how to manage a business enterprise, the management of a seaport has remained a field of neglected academic study. This book was written to overcome that neglect. It is designed to be a comprehensive introduction to the various facets of seaport administration; to give the reader a clear understanding of how these facets -- often studied as separate subjects during one's academic career -- interweave to make a cohesive whole and contribute to the successful management of a modern seaport.

1974 21p
MONITOR: NOAA-74092704-12
Prepared in cooperation with Harris and Sutherland, London (England) and Taylor Woodrow International Ltd., London (England).
Included in Proceedings of Floating Breakwaters Conference Held at Newport, R.I., 23-25 Apr 74, p213-232, COM-74-11637.

ABSTRACT: A basic feature of the Harris Breakwater (and the difference between it and the Bombardon) is that it presents a thin horizontal barrier to wave motion and causes dissipation of wave energy without creating major stresses in the structure and moorings. Extensive tests were carried out in the Solent on a one-tenth scale model. The test confirmed earlier opinion, and because test readings co-related the structural characteristics and natural sea-state conditions, basic design formulas were established and the calculations checked against actual results. The application of the Harris Breakwater has been extended from marinas to the protection of moorings for deep sea freighters and, combined with the S.B.M., for super-tankers. ABSTRACT: The transportation costs of petroleum products from refineries to markets have a more significant effect on the least cost location of deep-water ports than the economies created at the ocean leg of through movement by supertankers. In response to growing interest in energy supply problems, the Department of Transportation developed a model to study the impact of inland transportation costs of petroleum products on the least cost location of deep-water ports. The heuristic DOT model includes transportation costs (1) from ten crude sources to eighteen refining centers in the U.S., and (2) from these refining centers to 484 markets in the U.S. Other versions of the model which include 13 refining districts, 406 markets, 5 crude oil sources, existing product pipeline networks, refinery operating costs, and multiple deep-water port alternatives have also been built.

ABSTRACT: In response to growing interest in energy supply problems, the Department of Transportation developed a model to study the impact of inland transportation costs of petroleum products on the least cost location of deep-water ports. Interim results indicate that markets determine where the refineries should be; refinery locations ditate where deep-water ports should be; and deep-water port locations are only partially influenced by the overseas crude oil sources and supertanker economies. The model does not endorse any deep-water port site; it only serves as a tool to aid the decision makers by showing the cost differences between the optimum and suboptimum choices. The model is flexible enough to test alternative scenarios of refinery and deep-water port location.

ABSTRACT: The report presents a perception of the problem of ocean dumping as well as an overview of the more complex, longer-term problems of man's effects on the world's oceans. In addition to summaries of reports on ocean pollution by dumping, information is given on the effects of the development of offshore terminals, offshore powerplants, and oil and gas development. Information is given also on the effects of overfishing, and on efforts to increase understanding of the marine environment.

MONITOR: 18

ABSTRACT: The thesis examines the increasing dependence of the United States on foreign sources of major fuel and non-fuel mineral resources which appear to have potential requirements for deepwater ports and terminals. Major oceanborne bulk commodity import projections for crude petroleum, iron ore, bauxite, and alumina are presented. Principal bulk commodity ports are identified and major commodity movements are discussed. Past and possible future trends in the construction of large ocean bulk carriers are reviewed. Construction and transportation economies available via 'super' bulk carriers are examined with emphasis on 'super' tankers. The primary consequences of a failure to provide United States facilities to accommodate 'super' bulk carriers are identified and recent events in U.S. development of deepwater ports are presented. The major conclusion is that the United States, if it is to maintain its status as a leading economic power, should utilize the technological efficiency provided by 'super' bulk carriers. (Author)

ABSTRACT: In summarizing the study, the author indicates that it cannot be shown absolutely that an offshore terminal would have a cost advantage over a terminal located onshore. For this reason, cost in itself cannot be the sole determining factor in deciding the feasibility of the onshore deepwater terminal at Galveston. The economic impact of an onshore deepwater terminal at Galveston will be somewhat greater, throughout the region, than will the impact from an offshore oil terminal. In addition to the impact which could result from growth in oil refining, and supporting industry, the onshore port will have an impact of additional jobs and expenditures resulting from the operation of the port. Such things as tug hire, stevedoring, line handling and similar, port-related activities, will be of a greater magnitude than they would be at an offshore terminal.

ABSTRACT: The report outlines environmental aspects associated with the proposed deep draft channel from a terminus near Pelican Island to the 100 foot depth contour some 57 miles offshore in the Gulf of Mexico. The report presents some of the major environmental factors which would be affected by the project and outlines ways that the impact on the environmental components could and should be evaluated. Such environmental modifications can have both environmental costs in the form of environmental degradation or environmental benefits in the form of environmental enhancement. The project also has the potential for environmental pollution from accidental oil spills, dredge spoil disposal and other project activities, which must be considered as environmental degradation and cost.

ABSTRACT: The report is a planning summary relating to the port and harbor development system as considered by the Architecture Research Center, Texas A and M Univ. The solutions presented are not offered as panacea but rather to indicate a basic philosophy of planning representing an appropriate environmental character and general direction for growth with sufficient built-in flexibility to accommodate changing concepts as they occur. Concepts set forth concern offshore construction - mobile platforms, floating platforms, and artificial islands; site selection with consideration of meteorological factors; and various types of terminals to meet industrial needs.

Nov 73 89p
CONTRACT: MA-6562
PROJECT: NMRC-272-23100
MONITOR: NMRC-272-23100-R1

ABSTRACT: A review of information on oil barriers suitable for use offshore has been conducted. The technical literature, data from manufacturers and interviews with cognizant personnel at research, test and evaluation agencies, all through June, 1973 have been reviewed. Environmental conditions under which oil containment barriers at offshore oil terminals will be expected to operate effectively have been determined. The problem of oil containment has been studied and a body of performance expectations--conditions under which it is realistically expected that barriers will operate satisfactorily--has been developed. Commercially available barriers have been evaluated and barriers representing four distinct types of oil containment systems selected for a detailed analysis of the problems associated with each type. It is concluded that there is no commercially available oil containment barrier system which can by itself prevent the spread of oil under offshore conditions. Recommendations for further study to maximize the effectiveness of oil containment barriers at offshore terminals have been formulated. (Modified author abstract)

Index No. 72-318-Nte Report on A Review of the Status and Analysis of Characteristics.

ABSTRACT: The study is an attempt to review the capacity of ports on the U.S. Atlantic Coast, the past, present and projected future demand imposed upon them and their resulting ability to meet their future requirements. The changing functions of ports are discussed as they affect port operations themselves as well as the port interface with various modes of transportation. The facilities in the subject ports are analyzed including their past and current use, and an attempt made to derive a measure of port capacity. To analyze the competitive effects among ports serving the same region or regional parts, multiport models were developed. The use and structure of multipurpose ports and multiport models is discussed, with particular reference to the analysis of the U.S. Atlantic seaboard. Future needs are estimated by projecting demand and forecasting type and form of commodity movements as well as trends in transportation technology. The report concludes with the requirements for charge in the physical form and use of U.S. Atlantic Ports to meet such future demands. (Modified author abstract)

ABSTRACT: The onshore, or secondary, effects of deepwater terminal development on each of five areas selected as terminal locations. The five locations are Machias, Maine; the vicinity of Sany Hook, New Jersey; the Delaware Bay (New Jersey); Grand Isle, Louisiana; and Freeport, Texas. The relative impacts of a terminal in each area affect the relative suitability of each area as a terminal site. Relative impacts include the additional industrial development, production employment, air and water pollution, land use, population changes, etc., resulting from terminal development. For each of the five sites studied, an economic and environmental profile as of 1970 was developed for the terminal area itself and the larger land region surrounding the terminal area. Projections were made of the economic growth of each terminal area and associated region for the years 1985 and 2000 to establish a base or reference line against which the impact of a deepwater facility might be assessed.

ABSTRACT: This report considers the economic and environmental consequences of establishing a deepwater terminal in two general locations: near Cape May in Southern New Jersey, and near Sandy Hook in Northern New Jersey. Because two 'sets' of impacts were to be examined, two geographic definitions of the Mid-Atlantic were used, one to reflect the broader, more diffuse economic impact of industrial activities relating to deepwater oil terminal operations, and the second to recognize the more localized environmental impact of such operations. The economic definition includes all of New Jersey, Pennsylvania and Delaware, since it is these three states which would be most likely to experience the major part of economic expansion directly or indirectly associated with crude oil importation and processing. The environmental definition includes a limited portion of the same three states - essentially a 'belt' of land approximately 20-40 miles wide, beginning in Middlesex County, New Jersey, in the north, following the Delaware River from Trenton, New Jersey to Wilmington, Delaware, and ending in Cape May County, New Jersey. Given a continuation of historical industrial development patterns, and the present foreclosure of Delaware to deepwater terminal activity, the above-defined belt is the one most likely to experience the greatest environmental impact.

DESCRIPTORS: (*Marine terminals, *Tanker ships), (*Pollution, Marine terminals), (*Economic analysis, Marine terminals), Cape May, Sandy Hook, New Jersey, Impact, Economic factors, Economic development, Water pollution, Air pollution, Forecasting, Refineries, Population growth, Land use, Coasts, Maine, Machias Bay, Oils, Crude oil

ABSTRACT: Two potential deepwater terminal sites were assumed for the purposes of this study, one off Grand Isle, Louisiana, and the other off Freeport, Texas. The terminal locations assumed for this study represent the reality of what is occurring in Louisiana and Texas in regard to deepwater terminal development; these locations are under active consideration. The impact analysis on the Gulf Coast was evaluated on the basis of three major options: (1) no deepwater terminal anywhere along the Gulf Coast; (2) a deepwater terminal off Lafourche, Louisiana; and (3) a deepwater terminal off Freeport, Texas. These three major alternatives result in different state allocations of projected refinery capacity and associated development along the Gulf Coast.

DESCRIPTORS: (*Marine terminals, *Tanker ships), (*Pollution, Marine terminals), (*Economic analysis, Marine terminals), Grand Isle, Louisiana, Impact, Economic factors, Economic development, Water pollution, Air pollution, Forecasting, Refineries, Mississippi River, Population growth, Land use, Coasts, Houston Ship Channel, Oils, Crude oil, Mexico Gulf, Texas

ABSTRACT: The report provides an overall appraisal of the institutional problems associated with the planning, construction, and operation of deep draft port facilities in the U. S. and adjacent waters for the reception and transshipment of imported crude petroleum. It defines the public interest in such ports, the characteristics which distinguish such ports from conventional ports, problems of legal jurisdiction at international, federal, state, and local levels, the political setting, problems of finance, ownership, and economics, and regulation of deepwater ports and related land-side developments. It makes recommendations for legislation and organization. (Modified author abstract)

ABSTRACT: The study conducts an evaluation of the environmental impact of a deep-sea port off the Texas coast. Considered are both the non-spill impact of construction and operation of the port and the potential oil spill impact on the coastal environment. The scope was limited to two terminal locations, three designs of port facilities, and three sizes of oil spills. The study also considered the environmental impact of not constructing the port but expanding the present methods to meet the oil impact needs of the area. The major physical, biological and cultural features of the Texas Coastal Zone that might be impacted by the supertanker activity were inventoried. Models were developed to predict where oil from potential offshore oil spills would go and which environmental features would be affected. (Modified author abstract)

Deepwater Ports. To Accompany Legislation to Authorize the Secretary of the Interior to Regulate the Construction and Operation of Deepwater Port Facilities

Department of the Interior, Washington, D.C. Office of Economic Analysis.

Draft environmental impact statement.
C1255K1 FLD: 13B, 68H USGRDR7316
Jul 73 630p
MONITOR: DES-73-37

ABSTRACT: The action involves a bill to amend the Outer Continental Shelf Lands Act and to authorize the Secretary of the Interior to regulate the construction and operation of deepwater port facilities. The proposed legislation would allow the Secretary to license the construction and operation of deepwater port facilities when the level of imports of petroleum or other bulk commodities warrants the existence of such facilities. All ship traffic poses a potential pollution risk. The risk is related to ship density in congested areas as well as total tonnage of commodities being moved. Crude oil and petroleum products together comprise the single most visible and possibly the most dangerous pollutant. The effect of transporting future increased petroleum imports, via Very Large Cargo Carriers (VLCC's), through deepwater port facilities located on the Outer Continental Shelf is examined. Environmental impacts and adverse environmental effects are discussed.

DESCRIPTORS: (*Environmental impact statements, *Seaports), (*Legislation, Seaports), Government, Regulations, Operations, Construction, Licenses, Continental shelves, International trade, Crude oil, Water pollution

Oct 72 86p
REPT NO: WSG-MP-72-1
GRANT: NOAA-NC-1-72
MONITOR: NOAA-73033001

ABSTRACT: The authors derive and present a range of projections of traffic tonnage through Puget Sound Ports up to the Year 2000, broken down by commodity classifications. They discuss the land area requirements of port-related commerce, including the demand for land in industrial parks adjacent to terminal facilities but not necessarily providing direct access to the water. The causes and consequences of circumstances in which port-areas land is in relatively plentiful supply are analyzed and the effects of public subsidization of port districts on their investment patterns are discussed. An attempt is made to clarify existing usage of the term 'super-port'. Finally an effort is made to assess the necessity and desirability of this type of development, with special reference to the Nisqually Delta area and to the Port of Everett's plans for Jetty Island. ABSTRACT: The object of the report was to determine the environmental vulnerability of Machias Bay, Maine, to a proposed oil supertanker terminal. The study consists of a review and interpretation of the literature. A possible framework is proposed for assessing impacts of environmental changes. Processes considered are transport and dispersion, biological transfers and modifications, and biological effects. Separate consideration is given to a description of existing conditions along the eastern coast of Maine, the composition and characteristics of crude petroleum and petroleum products, the effects of oil on marine organisms, potential spill trajectories and behavior, and finally an assessment is made of the environmental vulnerability.

ABSTRACT: The study presents an overall environmental evaluation of a Superport operation at two hypothetical locations on the continental shelf off the southeast coast of Louisiana, establishes within the limits of available data the existing environmental conditions at and around the proposed sites, and predicts (a) the effects of an oil spill at or near the proposed sites and (b) the effects of operations. Only a superficial assessment was made of the effects that a Superport would have on people and their activities. No research was done on the impact of ancillary developments, such as pipelines, tank farms, new refining and/or manufacturing complexes. The latter activities would probably have a more serious and adverse impact on the environment than the port itself.

ABSTRACT: The authors present information which leads them to conclude that the primary impact of a Texas deepwater liquid-bulk terminal will be reflected in growth of the oil refining and related industries in the state. This growth will stimulate a spending and re-spending cycle throughout the economy. New jobs anticipated in Texas amount to 72,887 in 1975; 193,789 in 1980. Total impact resulting directly from the deepwater terminal, over and above that resulting from present refinery output is estimated to be $4.417 billion in 1975 and $11.828 billion in 1980. ABSTRACT: The study establishes tools by which the probability of liquid cargo spills from tankers and tanker-related loading and unloading facilities could be determined. A probability model for predicting the occurrence of cargo spills was developed and quantified using a Bayesian statistical approach. The probability model considers the size, cause, and location characteristics of cargo spills. A cargo spill was considered to be the entrance of any amount of liquid cargo whether intentional or accidental into the marine environment. (Author Modified Abstract)

ABSTRACT: The legal problems, economic considerations, environmental ramifications, and engineering aspects of constructing a deep water port in the Gulf of Mexico to service supertankers are discussed by various members of the Louisiana State University staff. It is recommended that a deep water port be located off the coast of Louisiana between Bayou La Fourche and Southwest Pass, that a governmental agency be created to deal specifically with the superport problems, and that the port be an oil-receiving terminal, with the potential capability of handling the flow of all types of commodities in the future. ABSTRACT: The report outlines the possible ramifications of the growth of the world tanker fleet, both in size and in numbers, and this growth's subsequent effect on Narragansett Bay. It examines both ship-to-ship and ship-to-shore offloading and the possible pollution effects of these techniques. The three main causes of pollution — bilge, pumping, transfer leakage and collisions - are also considered in terms of a future increase in tanker traffic on the Bay. A bibliography of some thirty works is also included. (Author)

ABSTRACT:

In the U. S., there is a bill before the Senate that would establish emergency reserves of petroleum to sustain the country for at least 90 days. Storage of such reserves would be costly. If salt domes were leached to provide capacity for storing petroleum for a 90-day requirement, each facility would be about 8 million dollars, pipelines another 5 million, and the cost of the oil unknown. The arrival of large tankers involves the construction of superports to accommodate them. The proposed Texas superport will include a tank farm that will cover 100 acres. The site of the proposed superport in Louisiana is in the middle of a large field of salt domes. The import situation is discussed and recommendations to alleviate the worsening situation are listed.

Three Dimensional Supertanker Computer Programs

Naval Construction Research Establishment Dunfermline (Scotland) (248200)
A4623K2 FLD: 13J, 9B, 60G, 62B USGRDR7215
Apr 71 101p
REPT NO: NCRE/R.564
MONITOR: NSTIC-30025

ABSTRACT: A FORTRAN computer program is described for the structural analysis of large tankers, using finite element techniques. The program includes specialised analysis procedures developed at NCRE, which represent the three dimensional structure as an assembly of two dimensional substructures, thereby greatly reducing the cost of the calculation. A data generation program reduces the vast amount of data to be prepared and a special built-in loading program calculates the loading of the structure from the internal fluid levels and the external draught. ABSTRACT: The study concerns three basic areas: Navigation; Sources of oil pollution and spill probability, and Pollution control. In the navigation section the tanker routes near land are detailed for Valdez and West Coast harbors as are the navigational aids. Next a review is made of past and present world tanker oil pollution sources and probabilities. The types of accidents and amount of oil spillage are given specifically for cases on the West Coast and Alaska. Finally contingency and pollution prevention planning for tankers is described in detail.

Report on Sea Grant Program.

ABSTRACT: To justify the expenditure of the large sums of money required to build an offshore port, a study must be made of the economy of Texas' Gulf Coast region to ascertain the impact that the port will have and to determine the dollars-and-cents benefits that will result from the port. A necessary prerequisite to constructing such a port is a study of its physical and economic feasibility. The work plan contained herein describes the individual studies required. Estimated cost of these studies is $460,000, and total time required to do them should not exceed 18 months. (Author)

ABSTRACT: The electrical effects developed by Lenard splashing near waterfalls under laboratory conditions, and within the closed environments of a bathroom and a cargo tank of an oil supertanker during seawater washing operations, show a consistent phenomenology. Both theory and experimental evidence suggest that electrical conditions in the closed container atmospheres are defined by an equation involving the number density of large carriers (large ions and haze droplets), time, and the electronic charge. The field within the closed container is approximately proportional to the product of the linear container dimension and the space-charge density. Conditions within an oil supertanker cargo tank during the washing operations are considered. It is concluded that the electrification is sufficiently intense for a large-scale spark streamer to have a good change of developing. This chance--and therefore the explosion hazard--becomes larger with an increase in the size of the cargo tank. (Author)

CONTRACT: MA-4561

ABSTRACT: The study consists of a review of requirements for port facilities anticipated for future emergencies in various parts of the world and, from this, develops information on which to preplan port facility equipment, with related manpower and planning data. The object was to form a mobile 'port package' tailored to specific operational requirements for unloading essential civilian and military support cargo, including fuel and perishables. The key element of the study has been that the equipment be mobile enough to allow prompt deployment of such a package to any port in the world on short notice. The study is structured in a systematic manner. Background information on natural and accidental disasters and military operations, gathered to define the circumstances that require use of the port package, is summarized in the Appendix. Chapter I is devoted to a definition of a typical mission and an operating situation and then development of port package design criteria. Using these design criteria, Chapter II explores and screens potential design concepts. Three candidate systems are carried over into Chapter III for detailed design and evaluation. With the design concepts firmly established, their application potential are evaluated in Chapter IV. (Author)

Order Options

Normal delivery time takes three to five weeks. It is vital that you order by number or your order will be manually filled, insuring a delay. You can opt for *airmail delivery* for a $2.00 charge per item. Just check the *Airmail Service* box. If you're really pressed for time, call the NTIS Rush Handling Service. (703) 557–4700. For a $10.00 charge per item your order will be airmailed within 48 hours. Or, you can pick up your order in the Washington Information Center & Bookstore or at our Springfield Operations Center within 24 hours for a $6.00 per item charge.

ITEM NUMBER ***	USER ROUTING CODE (see reverse)	Quantity			UNIT** PRICE	AIRMAIL* SERVICES	TOTAL PRICE
		Paper Copy	Micro-fiche	Other (specify)			

* Add $2.00 per item for First Class Delivery in North America;
Add $3.00 per item for Airmail Delivery outside North America.
** ALL PRICES SUBJECT TO CHANGE.
*** If ordering by title or if item ordered is a magnetic tape, please see reverse side.

Enter Grand Total $

USER ROUTING CODE: NTIS can label each item for routing within your organization. If you want this service put your routing code in the box marked USER ROUTING CODE (Limit eight characters).

SHIP & BILL SERVICE: Prepayment helps to expedite your order and can be accomplished through the use of an NTIS Deposit Account, check, money order, or American Express Card Account Number • For "Ship and Bill", NTIS charges $5.00 extra for *each order* (regardless of the number of items); $5.00 extra for *each* Published or On-line NTISearch; and $2.50 extra for *each* subscription • NTIS does not "Ship and Bill" for magnetic tapes, or for orders outside North America.

ORDERING MAGNETIC TAPE: (check mode)

☐ 7 track ☐ 200 BPI ☐ 556 BPI ☐ 800 BPI ☐ odd parity ☐ even parity

☐ 9 track. ☐ 1600 BPI ☐ 800 BPI (odd parity)

ORDERING BY TITLE: If ordering without an item number (by title only) allow an additional two weeks.

TITLE #1

Sponsor's Series #	Contract or Grant Number of Report	Date Published
Originator (Give specific laboratory, or division and location.)	Personal Author	
Turn to other side. Write "1" in the Item Number block and complete the rest of the line.		

TITLE #2
